nsf files are no longer supported. I was able to resolve this issue by removing my Domino installation and re-installed 8.5.3. I am running the same application as a service. I'm new to LotusScript and have no experience in writing Apps or installing and updating Domino. What would be the most efficient way to perform this update. A: Before you uninstall it, I would run diskpart to make sure that the machine doesn't have a copy of the "Data" partition. Then run uninsall Domino and then again run the upgrade. The reason why you need to do this is that the upgrade probably did an incomplete install that left behind a copy of the Domino data in the "Data" partition. If that was there you would get the error that you described. You can view the contents of the "Data" partition using the command mkdir f:\mydata There is a command that will fix this for you and remove all the "Domino 8.5.2 FP2 64Bit" files, but I don't have the source handy, so I can't give you a direct answer. In a comment you mentioned that the machine was restarted after the uninstall, so there may be other files on the machine that are from a backup that would need to be removed. Frequency dependent mean transit time and diffusion coefficient of nanosized copper in various substrates. A new approach to determine the diffusion coefficient and the frequency dependent mean transit time of nanosized copper in various substrates is developed. With this new method, it is possible to determine the diffusion coefficient from the frequency dependent mean transit time of single-source-sink and diffusion-limited surface recombination velocity. From the present study of the various nanosized copper films deposited on glass and quartz substrates, it is found that the data cannot be described by the conventional three-dimensional diffusion model. In addition, the diffusion coefficient is not constant but varies depending on the substrate and the size of the film. The determination of the mean transit time from the data obtained is based on a model proposed by Chow and Appel and involves three steps. The first step is to deduce the column length of the film, which was obtained by fitting the data to the Langmuir-Hinshelwood model. Then, the mean transit time is calculated by the second step. In the third step, the diffusion coefficient is deduced from the mean 82157476af
